**Tutte Matrix.** For a simple undirected graph G, Let M be a matrix with entries  $A_{i,j} = 0$  if  $(i,j) \notin E$ and  $A_{i,j} = -A_{j,i} = X$  if  $(i,j) \in E$ . X could be any random value. If the determinants are non-zero, then a perfect matching exists, while other direction might not hold for very small probability.

**Kirchhoff's Theorem.** For a multigraph G with no loops, define Laplacian matrix as L = D - A. D is a diagonal matrix with  $D_{i,i} = deg(i)$ , and A is an adjacency matrix. If you remove any row and column of L, the determinant gives a number of spanning trees.

Burnside's lemma / Pólya enumeration theorem, let G and H be groups of permutations of finite sets X and Y. Let  $c_m(g)$  denote the number of cycles of length m in  $g \in G$  when permuting X. The number of colorings of X into |Y| = n colors with exactly  $r_i$  occurrences of the i-th color is the coefficient of  $w_1^{r_1} \dots w_n^{r_n}$  in the following polynomial:

$$P(w_1, \dots, w_n) = \frac{1}{|H|} \sum_{h \in H} \frac{1}{|G|} \sum_{g \in G} \prod_{m \ge 1} (\sum_{h^m(b) = b} (w_b^m))^{c_m(g)}$$

When 
$$H = \{I\}$$
 (No color permutation): 
$$P(w_1, \dots, w_n) = \frac{1}{|G|} \sum_{g \in G} \prod_{m>1} (w_1^m + \dots + w_n^m)^{c_m(g)}$$

Total number of partitions of n distinct elements. B(n) = $1, 1, 2, 5, 15, 52, 203, 877, 4140, 21147, \dots$  For p prime,

Without the occurrence restriction:

$$P(1,...,1) = \frac{1}{|G|} \sum_{g \in G} n^{c(g)}$$

 $B(p^m + n) \equiv mB(n) + B(n+1) \pmod{p}$ 

where c(g) could also be interpreted as the number of elements in X that are fixed up to g.

**Pick's Theorem.**  $A = i + \frac{b}{2} - 1$ , where: P is a simple polygon whose vertices are grid points, A is area of P, i is # of grid points in the interior of P, and b is # of grid points on the boundary of P. If h is # of holes of P (h + 1 simple closed curves in total),  $A = i + \frac{b}{2} + h - 1$ .

**Xudyh Sieve**. 
$$F(n) = \sum_{d|n} f(d)$$

$$S(n) = \sum_{i \le n} f(i) = \sum_{i \le n} F(i) - \sum_{d=2}^{n} S\left(\left\lfloor \frac{n}{d} \right\rfloor\right)$$

Preprocess S(1) to S(M) (Set  $M = n^{\frac{2}{3}}$  for complexity)

$$S(n) = \sum f(i) = \sum_{i \le n} \left[ F(i) - \sum_{j|i,j \ne i} f(j) \right] = \sum F(i) - \sum_{i/j = d = 2}^{n} \sum_{dj \le n} f(j)$$

$$S(n) = \sum i f(i) = \sum_{i \le n} i \left[ F(i) - \sum_{j|i,j \ne i} f(j) \right] = \sum i F(i) - \sum_{i/j = d = 2}^{n} \sum_{dj \le n} dj f(j)$$

$$\sum_{d|n} \varphi(d) = n \qquad \sum_{d|n} \mu(d) = \text{if } (n > 1) \text{ then } 0 \text{ else } 1 \qquad \sum_{d|n} (\mu(\frac{n}{d}) \sum_{e|d} f(e)) = f(n)$$

$$p(0) = 1, \ p(n) = \sum_{k \in \mathbb{Z} \setminus \{0\}} (-1)^{k+1} p(n - k(3k - 1)/2)$$

where the sum is over all spanning trees T in  $K_n$  and  $d_{T(i)}$  is the degree of i in T

**Taylor's theorem**<sup>[4][5][6]</sup> — Let  $k \ge 1$  be an integer and let the function  $f: \mathbb{R} \to \mathbb{R}$  be k times differentiable at the point  $a \in \mathbb{R}$ .

Then there exists a function  $h_k: \mathbf{R} \to \mathbf{R}$  such that

## Triangles

Side lengths: a, b, c

Semiperimeter:  $p = \frac{a+b+c}{2}$ 

Area:  $A = \sqrt{p(p-a)(p-b)(p-c)}$ 

Circumradius:  $R = \frac{abc}{4A}$ 

Inradius:  $r = \frac{A}{p}$ 

Law of tangents:  $\frac{a+b}{a-b} = \frac{\tan\frac{\alpha+\beta}{2}}{\tan\frac{\alpha-\beta}}$  Law of sines:  $\frac{\sin\alpha}{a} = \frac{\sin\beta}{b} = \frac{\sin\gamma}{c} = \frac{1}{2R}$  Law of cosines:  $a^2 = b^2 + c^2 - 2bc\cos\alpha$ 

Length of median

(divides triangle into two equal-area triangles):

 $m_a = \frac{1}{2}\sqrt{2b^2 + 2c^2 - a^2}$ 

Length of bisector (divides angles in two):

$$s_a = \sqrt{bc \left[1 - \left(rac{a}{b+c}
ight)^2
ight]}$$

Symbol Newtona:

$$\sum_{k=0}^{n} \binom{n}{k}^2 = \binom{2n}{n} \qquad \sum_{k=1}^{n} k \binom{n}{k}^2 = n2^{n-1} \qquad \sum_{k=0}^{n} \binom{r}{k} \binom{s}{n-k} = \binom{r+s}{m+n}$$

Liczby Stirlinga I rodzaju (liczba permutacji n elementow o k cyklach):
